Business Plan

Market opportunity, positioning, pricing, economics, go-to-market and launch gates

ConstructionFlow AI | Kosovo-first, multilingual SaaS | Version 1.0

Document purpose

A practical planning reference. All costs, dates, market assumptions, pricing and estimates are illustrative and must be validated with local customers, engineering specialists, legal advisers and actual vendor quotes.

Contents

1. Executive summary

2. Market opportunity and customer discovery

3. Product and competitive positioning

4. Business model and pricing

5. Go-to-market strategy

6. Operations and organization

7. Financial scenarios and break-even

8. Risks, compliance and controls

9. Milestones, KPIs and decision gates

1. Executive summary

ConstructionFlow AI is a Kosovo-first B2B SaaS platform for small and mid-sized contractors, developers and construction project managers. It combines project tracking, procurement, document intelligence and site reporting. Its differentiator is Albanian-first workflows with auditable AI assistance, rather than autonomous engineering decisions.

• Initial wedge: quotations, invoices, purchase orders and daily site reports.

• Primary buyer: owner/director of a contractor managing 2-10 concurrent projects.

• Economic hypothesis: save 4-10 administrative hours per project per week; validate through timed pilots, not marketing claims.

• Go/no-go: at least 3 paid pilot commitments and repeatable weekly usage before expanding scope.

2. Market opportunity and customer discovery

Target segments

Segment	Jobs to be done	Buying trigger
Small contractor	Capture expenses, materials and daily reports	Lost paperwork and budget surprises
Developer / general contractor	Monitor several sites and subcontractors	Poor visibility across projects
Quantity surveyor / project manager	Compare bids and evidence decisions	Manual comparison effort
Subcontractor	Submit progress, timesheets, variations	Slow approvals and payment disputes

Research plan

• Interview 12-20 companies in Prishtina, Prizren, Peja and other markets; stratify by company size and construction specialty.

• Ask for anonymized sample supplier offers, invoices, BOQs, daily logs and project spreadsheets; measure baseline process times.

• Map competing alternatives: Excel, WhatsApp, email, accounting software and established construction SaaS; validate local language and price gaps.

• Assess connectivity at sites, mobile usage, tax-document workflows, approval authority and data residency preferences.

3. Product and competitive positioning

Position as the operational layer between the construction site, procurement and owner reporting. Do not attempt to replace CAD, BIM authoring, accounting, structural design or licensed engineering review in the MVP.

Capability	MVP	Later
Multi-project dashboard	Yes	Portfolio forecasting
Quote comparison	Yes	Supplier performance scoring
Invoices and document extraction	Yes	Accounting integrations
Albanian voice-to-site-report	Pilot	Offline mobile capture
BOQ / drawing quantity extraction	No	Engineer-verified specialized module
Photo-based progress assessment	No	Validated computer vision workflows

Differentiation

• Albanian-language forms, terminology and speech; optional English and Serbian.

• Human-approved AI results with document references, confidence and correction history.

• Low-friction onboarding from PDF, spreadsheet, photo and voice note.

4. Business model and pricing

Plan	Illustrative price / month	Guardrails
Starter	EUR 39	1 active project, 3 seats, limited AI credits
Professional	EUR 99	5 projects, 15 seats, moderate AI allowance
Enterprise	EUR 249+	Negotiated seats, storage, integrations and SLA

• Bill AI-intensive OCR, transcription and LLM usage against a transparent monthly allowance and overage policy.

• Optional paid onboarding: historical data import, training and workflow configuration.

• Do not promise unlimited AI processing or unlimited storage at flat prices.

Unit economics model - illustrative

Metric	Pilot assumption
Professional monthly revenue	EUR 99
Infrastructure + AI variable cost	EUR 15-35 per account / month
Gross contribution before support	EUR 64-84 / month
Acquisition cost	Measure during first 10 paying customers
Churn and retention	Track monthly; no assumed benchmark

5. Go-to-market strategy

• Phase 0: recruit 5 design partners, preferably 2 contractors, 1 developer, 1 project manager and 1 subcontractor.

• Run 30-day pilots using real but permissioned project documents and explicit data-processing terms.

• Show before/after demonstrations: three supplier quotations processed in minutes, daily report drafted from a voice note.

• Use referrals from accountants, project managers, engineers and construction suppliers.

• Offer onboarding in Albanian and guided imports from Excel; focus on one city before nationwide outreach.

• Expand regionally only after localization, regulations and document formats are verified.

6. Operations and organization

Function	Initial owner	Operational requirement
Product / customer discovery	Founder	Weekly interviews and prioritization
Engineering / DevOps	Founder + contractor	Secure deployments and monitoring
Construction domain review	External engineer / QS	Validate terminology, estimates and workflows
Sales / onboarding	Founder	Demos, training and support
Legal / privacy / accounting	Local advisers	Contracts, data processing and tax obligations

• Customer support target: respond to high-severity outages same business day during pilot; formal SLAs only when staffed.

• Maintain a written incident process, backup restoration tests, access review and deletion procedure.

7. Financial scenarios and break-even

The following is a sensitivity exercise, not a forecast. Assume blended monthly subscription revenue of EUR 85 per paying account and EUR 25 variable service cost per account; fixed monthly operating costs are assumed at EUR 2,000, excluding founder salary unless explicitly included.

Paying accounts	Monthly revenue	Contribution after variable costs	After EUR 2,000 fixed
10	EUR 850	EUR 600	-EUR 1,400
25	EUR 2,125	EUR 1,500	-EUR 500
40	EUR 3,400	EUR 2,400	EUR 400
75	EUR 6,375	EUR 4,500	EUR 2,500

• Illustrative break-even: 34 paying accounts at EUR 60 contribution each, before taxes, financing and founder compensation if not included.

• Track cash runway, onboarding labor, document volume, AI unit costs, payment collection and support time.

• Prepare base, downside and upside scenarios after first paid pilots; never extrapolate solely from interviews.

8. Risks, compliance and controls

Risk	Mitigation
Wrong quantities or estimates	Engineering approval, no autonomous design sign-off
Sensitive project and employee data	Tenant isolation, RBAC, encryption, retention controls
Hallucinated contract interpretations	Grounded retrieval, citations, abstention
Low adoption on site	Fast mobile forms, voice and offline roadmap
AI operating-cost spikes	Quotas, batching, usage monitoring
Vendor lock-in	Provider abstraction and exportable data
Regulatory differences	Local legal review before launch or expansion

• Check applicable Kosovo privacy, employment, accounting, construction and procurement rules with qualified advisers; do not assume that generic EU templates alone establish compliance.

9. Milestones, KPIs and decision gates

Period	Milestone	Gate
Weeks 1-2	Interviews, sample documents, prototype	3 strong design partners
Weeks 3-6	Project + supplier + expense workflows	End-to-end tasks completed
Weeks 7-10	OCR, AI comparison, daily reports	Human-reviewed extraction quality
Weeks 11-14	Live pilots and fixes	3 paid commitments
Months 4-6	Retention and sales repeatability	Weekly active companies, low correction burden

• Core KPIs: active projects, weekly active site reporters, documents processed, extraction correction rate, time saved per workflow, trial-to-paid conversion, retention and gross margin.

• Stop or pivot if the buyer does not own the problem, workflows are too variable, or correction effort exceeds manual effort.
